

FARM MANAGEMENT SYSTEM

Project Demonstration Documentation

Team Leader: V. Deepak

Team Members: B. Haridasan, R. Gokulakrishnan, G. Bharath

1. Introduction

The Farm Management System demonstrated in the project video is a web-based application intended to organize farm-related information and provide a structured environment for managing farmers, farms, crops and related records. The demonstration shows the project through a Skill Wallet workspace and then presents the underlying Salesforce environment used to configure and view the application's data and administrative components.

2. Project Objective

The main objective is to create a centralized farm-management workspace where relevant farm data can be maintained as structured records, configured through a cloud platform, and viewed through reports and dashboards.

3. Platform and Environment

The demonstration visibly uses a Skill Wallet project workspace and Salesforce Lightning administration/development screens. Salesforce Setup, Object Manager, Profiles, Roles and the Lightning Usage App are shown.

4. Project Workflow Demonstrated

Phase 1 – Project Workspace

The Farm Management System is opened in the Skill Wallet workspace. The Team tab displays the project team and role assignments, with Overview, Workspace and Kanban sections.

Phase 2 – Team and Activity Management

The Team area shows team members and assigned roles. An Assign Stories section is visible for organizing project activities or stories.

Phase 3 – Salesforce Configuration

The demonstration moves to Salesforce Setup. Object Manager is used to inspect custom objects including Crop and Farm, with object details and field information shown.

Phase 4 – User Access and Administration

Salesforce Profiles and Roles are displayed. These areas are used to manage user permissions, access levels and role hierarchy.

Phase 5 – Reports and Visualization

The Lightning Usage App displays a report titled 'Farmers with farms'. The video shows tabular farm-related records and a gauge-style visualization.

5. Main Modules / Components

Component	Purpose
Team Management	Displays team members, project roles and project workspace information.
Project Workspace	Provides access to Team, Overview, Workspace and Kanban areas.
Farm Object	A Salesforce custom object shown in Object Manager for maintaining farm-related data.
Crop Object	A Salesforce custom object shown in Object Manager for maintaining crop-related data.
Profiles	Used to view/configure user permission and access settings.
Roles	Used to view the role hierarchy and organize access responsibilities.
Reports	Provides a structured view of farm-related records.
Dashboard / Visualization	The demonstration includes a gauge visualization for the 'Farmers with farms' report.

6. Data and Records Shown

The video shows Salesforce custom-object records and fields associated with farm management. The Object Manager screens show objects such as Crop and Farm, while the final report presents farmer/farm information in a list and visual gauge. The exact field values are treated as demonstration data from the recorded screen.

8. Conclusion

The demonstration presents a Farm Management System organized through a project workspace and configured using Salesforce. It covers team management, custom objects for farm and crop data, administrative access through profiles and roles, and reporting through the Lightning Usage App. These components provide a foundation for maintaining farm information in a centralized cloud-based system.
